### ECE368: Probabilistic Reasoning

### Lab 1: Classification with Multinomial and Gaussian Models

Name: Shadman Kaif Student Number: 1005303137

You should hand in: 1) A scanned .pdf version of this sheet with your answers (file size should be under 2 MB); 2) one figure for Question 1.2.(c) and two figures for Question 2.1.(c) in the .pdf format; and 3) two Python files classifier.py and Idaqda.py that contain your code. All these files should be uploaded to Quercus.

#### Answer to 1a in words:

## 1 Naïve Bayes Classifier for Spam Filtering

 $p_d = \frac{\text{Total \# of Occurences of word d in Spam+1}}{\text{Total \# of Words in Spam+Total \# of Distinct Words in both Spam and Ham}}$   $q_d = \frac{\text{Total \# of Occurences of word d in Ham+1}}{\text{Total \# of Words in Ham+Total \# of Distinct Words in both Spam and Ham}}}$ 

1. (a) Write down the estimators for  $p_d$  and  $q_d$  as functions of the training data  $\{\mathbf{x}_n, y_n\}, n = 1, 2, ..., N$  using the technique of "Laplace smoothing". (1 pt)

Let D be the total # of distinct words in spam and hom.

$$P_{d} = \underbrace{\sum_{i=1}^{N} \chi_{id} 1(y_{i}=1) + 1}_{\substack{i=1 \ i=1}} \underbrace{R_{i}}_{\substack{j=1 \ j=1}} \chi_{ij} 1(y_{i}=0) + 1}_{\substack{j=1 \ j=1}} \underbrace{\sum_{i=1}^{N} \chi_{ij} 1(y_{i}=0) + 0}_{\substack{j=1 \ j=1}} \underbrace{\chi_{ij}}_{\substack{j=1 \ j=1}} \underbrace{\chi_{ij}}_{\substack{$$

- (b) Complete function learn\_distributions in python file classifier.py based on the expressions. (1 pt)
- 2. (a) Write down the MAP rule to decide whether y=1 or y=0 based on its feature vector  $\mathbf{x}$  for a new email  $\{\mathbf{x},y\}$ . The d-th entry of  $\mathbf{x}$  is denoted by  $x_d$ . Please incorporate  $p_d$  and  $q_d$  in your expression. Please assume that  $\pi=0.5$ . (1 pt)

$$y = \underset{y}{\operatorname{argmax}} \frac{P(x|y) P(y)}{P(x)}$$

$$p(y=1) = p(y=0) = 0.5$$

$$y = \underset{y}{\operatorname{argmax}} P(x|y) = \underset{x_1 \mid x_2 \mid \cdots \mid x_D \mid}{\underbrace{\left( \frac{x_1 + x_2 + \cdots + x_D}{x_1} \right)!}} \prod_{d=1}^{D} P(xd|y)^{xd}$$

$$\lim_{x \to \infty} P(x|y) = \underset{x_1 \mid x_2 \mid \cdots \mid x_D \mid}{\underbrace{\left( \frac{x_1 + x_2 + \cdots + x_D}{x_1} \right)!}} \prod_{d=1}^{D} P(xd|y)^{xd}$$

- (b) Complete function classify\_new\_email in classifier.py, and test the classifier on the testing set. The number of Type 1 errors is 2, and the number of Type 2 errors is 4. (1.5 pt)
- (c) Write down the modified decision rule in the classifier such that these two types of error can be traded off. Please introduce a new parameter to achieve such a trade-off. (0.5 pt)

Write your code in file classifier.py to implement your modified decision rule. Test it on the testing set and plot a figure to show the trade-off between Type 1 error and Type 2 error. In the figure, the x-axis should be the number of Type 1 errors and the y-axis should be the number of Type 2 errors. Plot at least 10 points corresponding to different pairs of these two types of error in your figure. The two end points of the plot should be: 1) the point with zero Type 1 error; and 2) the point with zero Type 2 error. Please save the figure with name nbc.pdf. (1 pt)

# 2 Linear/Quadratic Discriminant Analysis for Height/Weight Data

1. (a) Write down the maximum likelihood estimates of the parameters  $\mu_m$ ,  $\mu_f$ ,  $\Sigma$ ,  $\Sigma_m$ , and  $\Sigma_f$  as functions of the training data  $\{\mathbf{x}_n, y_n\}$ , n = 1, 2, ..., N. (1 **pt**)

$$U_{m} = \frac{1}{\# \text{ of males}} \sum_{i=1}^{N} 1 \{y_{i} = 1\} x_{i}$$

$$U_{f} = \frac{1}{\# \text{ of females}} \sum_{i=1}^{N} 1 \{y_{i} = 2\} x_{i}$$

$$Z_{m} = \frac{1}{\# \text{ of males}} \sum_{i=1}^{N} (x_{i} - u_{m}) (x_{i} - u_{m})^{T} 1 \{y_{i} = 1\}$$

$$Z_{f} = \frac{1}{\# \text{ of females}} \sum_{i=1}^{N} (x_{i} - u_{f}) (x_{i} - u_{f})^{T} 1 \{y_{i} = 2\}$$

$$Z = \frac{1}{N} \binom{N}{Z} (x_{i} - u_{m}) (x_{i} - u_{m})^{T} 1 \{y_{i} = 1\} + (x_{i} - u_{f}) (x_{i} - u_{f})^{T} 1 \{y_{i} = 2\}$$

(b) In the case of LDA, write down the decision boundary as a linear equation of  $\mathbf{x}$  with parameters  $\mu_m$ ,  $\mu_f$ , and  $\Sigma$ . Note that we assume  $\pi = 0.5$ . (0.5 pt)

In the case of QDA, write down the decision boundary as a quadratic equation of  $\mathbf{x}$  with parameters  $\mu_m$ ,  $\mu_f$ ,  $\Sigma_m$ , and  $\Sigma_f$ . Note that we assume  $\pi = 0.5$ . (0.5 pt)

$$-\frac{1}{2}(x-u_m)^{T} \xi_m^{-1}(x-u_m) - \frac{1}{2}\log(|\xi_m|) = -\frac{1}{2}(x-u_f)^{T} \xi_f^{-1}$$

$$(x-u_f)^* - \frac{1}{2}\log(|\xi_f|)$$

- (c) Complete function discrimAnalysis in Idaqda.py to visualize LDA and QDA models and the corresponding decision boundaries. Please name the figures as Ida.pdf, and qda.pdf. (1 pt)
- 2. The misclassification rates are 0.11818 for LDA, and 0.10909 for QDA. (1 pt)
